

Alcohol sales (liters) / population > 21, Iowa, U.S.

Space (county) time (monthly) cubes: January 2017- June 2022

Each space-time cube represents a snapshots of sales (in liters) of alcohol divided by population 21 years old and older, over time. in this case, time consists of monthly observations for each county.

The reason for the presence of some negative values (red) is that observations that are missing (specific months for some counties) are imputed by arcGIS. Counties with very low values can cause the imputer to output negative values.
